Step 1 : Start
Step 2 : Input string and store in user_string
Step 3 : Set result as an empty string
Step 4 : Find length of user_string and store in l
Step 5 : Set i = l – 1
Step 6 : Repeat steps while i is greater than or equal to 0
Step 7 : Get the character at index i from user_string
Step 8 : Add the character to result
Step 9 : Decrease i by 1
Step 10 : Go back to Step
Step 11 : Print result
Step 12 : Stop

10.1.2. Reverse a String

01:11

Write a Python program that prints the reverse of a given input string. The program uses a **reverse_string()** function that takes a string as input and returns its reversed string.

Input Format:

- The program prompts "Enter a string: " and reads a string representing the string to be reversed.

Output Format:

- The first line prints the original string, in the format:

```
Original String: <input_string>
```

- The next line prints the reversed string, in the format:

```
Reversed String: <reversed_string>
```

Sample Test Cases +

Explorer

ReverseS...

Submit

```python
def reverse_string(user_str):
    re = ""
    l = len(user_str)
    for i in range(l-1,-1,-1):
        re += user_str[i]
    return re
user_input = input("Enter a string: ")
result = reverse_string(user_input)
print(f"Original String: {user_input}")
print(f"Reversed String: {result}")
```
